

The Mind is Not the Brain

by [Kenneth Francis](#) (March 2022)

There's been a lot of talk lately about AI being on the cusp of reading our thoughts (consciousness). But can a computer or some form of AI ever achieve this? It's highly unlikely because mental states are not physical, despite the brain manifesting them via communication with other human beings and/or the external world.

Computers and other forms of AI are 100% physical devices, thus the best they can ever achieve at expressing our thoughts is by disrupting them in the 'machinery' of the brain. In other words, frustrating the 'ghost' (consciousness) from operating the 'machine' (wet physical brain).

Think about it: How can a robot ever have a spiritual vision of reality? How can it even be emotional? And even if it could tap into our feelings, how confused would it be with such a complex network of semantics and emotional states? In fact, it would probably view movies like *Deliverance* or *Fatal Attraction* as a love stories.

Last month (Feb 22), in an article in the U.S. Sun newspaper, Ellie Cambridge wrote: "The first ever recording of a dying brain has revealed we might relive some of our best memories in our last moments. Scientists accidentally captured our most complex organ as it shut down, showing an astonishing snapshot into death."

According to the article, the study was published in *Frontiers in Aging Neuroscience*, which claimed their data provided the first evidence from the dying human brain in a non-experimental, real-life acute care clinical setting and advocate that the human brain may possess the capability to generate coordinated activity during the near-death period. This is just one single case study, with a brain that had already been injured due to the epilepsy.

The German philosopher Gottfried Wilhelm Leibniz (1646–1716) wrote: "It must be confessed, moreover, that perception, and that which depends on it, are inexplicable by mechanical causes, that is, by figures and motions. And, supposing there were a machine so constructed as to think, feel and have perception, we could convince of it as enlarged and yet preserving the same proportions, so that we might enter it as a mill. And this granted, we should only find on visiting it, pieces which push one against another, but never anything by which to explain a perception. This must be sought for, therefore, in the simple substance and not the composite or in the machine (Section 17, *Monadology*, 1714)."

In ancient times, the debate on consciousness/thoughts (the mind/body problem) goes back to Plato and ancient Greece. However, it really got kick-started with Descartes and Locke during the 17th century, the former saying, "I think, therefore I am." Could a robot ever think such a thing? Very doubtful.

Without even a basic understanding of what consciousness is, the idea of putting it into a machine, while not difficult to

imagine in the fantasy of science fiction, becomes almost impossible to grapple with when it comes down to real and practical implementation.

The field of AI in the last twenty years has made many claims that one day we will create a robot with a consciousness similar, if not the same, as our own. So far, no one has achieved this.

Yet, even though the field of AI has evolved on tasks of solving practical problems such as complex scheduling, rather than on emulating human behaviour, many AI scientists still believe that the original goals of AI will become a reality in the near future. Unfortunately, a lot of scientists don't believe in the human soul.

But even without recourse to the notion of a soul, there are a number of ways in which the mind is not simply brain. The wet, grey organ known as the brain does not have mental states such as love, hate or sadness. Then there is the problem of propositional attitudes such as fear, hope, desire, wish, dread and think.

As to where the mind resides, that is the biggest mystery in philosophy. Although it interacts with the brain, it can't be a kind of invisible vapour hovering above one's head. Nor can it be located in some part of the universe, as it's supernatural and outside of space and the material world.

If epiphenomenalism (mind is brain) is true, then how come fake drugs sometimes work in placebo effects? And at what point in evolution did the atoms in brains develop morals? That we can have logic, reason and truth evolving out of a material process that is aimless, purposeless, misguided and unaware of self seems absurd.

Materialism would never have endowed human beings with consciousness, as zombie clones would reproduce and spread their genes more effectively. If intelligence emerged from

brute matter and not a Superior Mind then robotic ideas of life and the cosmos are not to be taken seriously because they could never tackle metaphysical questions reliably. Should one trust a machine made of blind chemicals or computer software functioning on syntactic information but oblivious to philosophical truths?

For if a robot could read thoughts as material entities that would also have to include laws of logic, which is absurd. One can hit a rock or a tree with a hammer but not a law of logic. The same applies to the existence of objective moral values and duties, aesthetic values, love, the existence of other minds other than one's own, proving the duration of the past, beauty, and proving science and the existence of the external world.

Could a carbon android at the funeral of a child read the thoughts and emotions of the mourners? Or would it view the death of a loved one as nothing more than the rearrangement of atoms in a wooden box?

Some scientists speak as though the mysteries of consciousness and mental experience have been fathomed. That is certainly not the case. There is something non-material about thought and experience which has not been explained by scientific materialism.

To draw an analogy: the brain is like a motor car and the mind a human who drives it. If the car ('brain') is damaged or the engine not tuned properly, then the driver ('mind') will not be able to drive it properly. So, rest assured: The only ones that can ever read your mind are yourself... and God.
